DESCRIPTION

Front interface and Engineering Tools

Control parameter adjustment in seconds has now also been implemented in the KS 40 class of instruments. Via the BlueControl software incl. its simulation functions, and especially the convenient BluePort® front panel interface, the required set-up for a specific control task can be determined without a detailed study of the operating instructions. Off cause almost all adjustments can be done comfortably over the instrument front. (see page 5, BlueControl)

Limit values

The measured signal can be scaled freely and monitored for limit values and sensor break. Process status signalling is possible by two relays and six LEDs in total. Moreover, an alarm or the displayed value can be output as a 0/4...20 mA or 0/2...10 V signal via an analog output.

Alarm hold function

Alarm statuses can be configured so that they remain unchanged until acknowledgement.

Controller

Apart from application as an indicator, Digital 280-1 can be used as a signaller or on/off controller, as a two-point or a continuous controller.

Oxygen measurement:

When using a heated lambda probe, the oxygen concentration can be displayed, controlled and output directly as a standard signal.

Range with O₂ measurement: 0,0001% (1ppm) to 100.00%
Indication of values below 1 ppm is possible via the voltage value display.

Linearization with 15 segments

Non-linear signals, e.g. filling quantities, flows, etc. can be adapted by means of user-specific linearization.

Plug-in module

As a plug-in module, Digital 280-1 can be replaced very quickly without tools and without impairing the wiring.

Password protection

If required, access to the various operating levels can be protected with a password.

ACCESSORY EQUIPMENT

BlueControl (Engineering Tool)

PC-based program for configuring, setting parameters, and operating (commissioning) Digital indicator, controller and temperature limiter of the BluePort® series.

Software requirements:
Windows 95/98/NT/2000.

The built-in simulation serves to test the controller settings, but can also be used for general training and observing the interaction between controller and control loop.

Display of two parameters was suppressed:

Name	Description	Visible
Lim	Limit	<input checked="" type="checkbox"/>
L.1	lower limit 1	<input type="checkbox"/>
H.1	upper limit 1	<input type="checkbox"/>
HYS.1	hysteresis 1	<input checked="" type="checkbox"/>
dEL.1	limit 1 delay	<input checked="" type="checkbox"/>
L.2	lower limit 2	<input checked="" type="checkbox"/>

Simulation

Configurations that can only be implemented via the BlueControl software (not via the front-panel keys):

- Customer-specific linearizations
- Enable „forcing“ for inputs/outputs. Forcing allows to write the analog and digital inputs and outputs via Modbus interface.
- Adjustment of limits for operating hours and switching cycles
- Switch-over to 60 Hz mains frequency
- Disable operator actions and operating levels, plus password definition
- Prevent automatic optimization of cycle times T1, T2

Hardware requirements:

A PC adapter (see „Accessories“) is required for connecting the controller.

Updates and demo software can be downloaded from:
